

Stages of the calculation

Choices that affect the result or its interpretation but are invisible in the final table

Three questions that one concentration table cannot answer by itself

- 1 **Reconstructable?** Do the stated inputs, equations, and conventions return the reported numbers?
- 2 **Physically supported?** Is there line-specific evidence that the plasma-model assumptions hold?
- 3 **Fit for purpose?** Do the results agree with independent information within a stated uncertainty?
